

NXTWAVE · ENTERPRISE GENAI

GenAI Excellence Trainer Script

Full verbatim edition

The complete word-for-word talk track for the full 8-hour live webinar — VEKA India. Every line to say, every demo narrated, debrief scripts, and a scripted answer bank, keyed to the HTML deck.

READ ME FIRST

How to use this script

This is the **full talk track** for eight hours. It's written so you could, in a pinch, read it aloud and run the day — but that's the floor, not the ceiling. Keep the meaning and the punchlines; say it in your own voice; follow the room when it's alive.

Four markers:

SAY — the actual words. Deliver close to verbatim, especially demo punchlines.

🔊 **DEBRIEF** — what to say *while* reading participants' outputs aloud. Adapt to what you actually see; the phrasing shows you the shape.

▶ **DO** — a stage direction: click, type, start the timer. Not spoken.

[pause] / [read aloud] — timing and delivery cues.

Solo-trainer rhythm: the on-screen timer is your co-trainer (T) · pair people into table buddies so you never review 30 outputs alone · read 2–3 chat entries aloud rather than going round the room · when behind, trim the talking (SAY), never the doing (activities). A scripted **answer bank** for the recurring questions is at the very back — bookmark it.

The day at a glance

Clock	Block	Slides	Min
09:00–09:55	Hour 1 — Ignite	4–9	55
09:55–10:45	Hour 2 — Anatomy of a prompt	10–15	50
10:45–10:55	Break	16	10
10:55–11:50	Hour 3 — High-stakes writing	17–24	55
11:50–12:35	Lunch	25	45
12:35–13:30	Hour 4 — Finance & Operations	26–32	55
13:30–14:20	Hour 5 — Sales & HR	33–40	50
14:20–14:30	Break	41	10
14:30–15:20	Hour 6 — From prompt to asset	42–48	50
15:20–16:30	Hour 7 — Capstone sprint	49–55	70
16:30–17:00	Hour 8 — Showcase & sustain	56–62	30

HOURL 1 · SLIDES 4-9 · 55 MIN

Ignite

OBJECTIVE Everyone sends a real prompt and gets a usable output in the first hour. Kill the fear; install one mindset shift. **VEKA OUTCOME** Each person holds one message they could send today.

Open — welcome & the promise 0:00-0:04

- ▶ *Deck full-screen on the divider. Stand, smile, wait for quiet before the first line.*

SAY

Good morning, everyone, and welcome. I'm [NAME], and I'll be with you for the whole day. Before I say anything about artificial intelligence, let me tell you how today is going to feel — because it's probably not what you're expecting from a training.

Most trainings, you sit, you listen, someone reads slides at you, and by Friday you've forgotten all of it. Not this one. For the next eight hours we're going to spend almost none of the time listening to me. Roughly eighty percent of today, *you* are the one doing the work — on your keyboard, on your own real VEKA tasks.

Here's my promise. By five o'clock this evening you will not have *learned about* AI. You will have *used* it — and you'll walk out holding things you actually made. Real emails you can send. Templates your whole team can reuse. And a working solution to some annoying, repetitive problem in your own job. That's the deal.

Set the room — the three of you 0:04-0:07

- ▶ *Light show-of-hands to read the room and make everyone feel seen.*

SAY

Quick show of hands, be honest, no judgement. Who here works with technical tools every day — engineering, IT, maintenance? ... Good. Now, who's comfortable with software like Tally or SAP or Excel, but has barely touched AI? ... Right, quite a few. And who's thinking, "honestly, I'm not a tech person, I just want to get through my day without another complicated tool"? ... Thank you for your honesty — hands down.

Here's why I asked. Every single one of those hands is going to be busy and successful today, at the same time, in the same room. This isn't a coding class. If you can send a WhatsApp and brief a colleague, you have every skill you need. On every exercise you'll see three options on screen — a **Core** task everyone does, a **Scaffold** with the words half-filled-in for you if you want the safety net, and a **Stretch** for anyone who wants to push. You pick your lane, every time. Nobody gets left behind. Nobody gets bored. Deal?

The case — why AI, why here 0:07-0:14

- ▶ Advance to slide 5. Don't read bullets — tell it, with VEKA texture.

SAY

So let me tell you what I actually believe, because it's what today is built on. AI is not some magic thing that happens in a laboratory in California. The useful version of it happens at *your* desk, on the VEKA floor, this week — on the boring stuff.

Think about the parts of your job that eat time and give nothing back. That email you rewrite five times before you dare send it — the supplier who's late again, the shift handover, the "we're going to miss the date" message to a customer. The reconciliation you quietly dread, where you're staring at a Tally export at six in the evening trying to work out why two numbers refuse to agree. The maintenance log that just... sits there, because who has an afternoon to make sense of a month of breakdowns?

Every one of those has a faster version — and you're going to build several of them today. But — and this is the part people get wrong — in that faster version, you do not disappear. You are still the expert. You still decide, you still sign off, you still know things the machine never will. The AI is just a very fast, very tireless intern. It'll happily do the tedious first draft at midnight and never once get offended when you say, "No. Not like that. Do it again."

And that's the one idea I want to plant before we touch a keyboard. The whole day comes down to a single shift: **stop asking the AI a question, and start giving it a briefing**. Who you are. What's going on. What a good result looks like. Brief it like you'd brief a sharp new intern — don't type at it like it's a search box. Let me show you exactly what I mean, because the difference is bigger than you'd think.

THE WOW — robotic email → VEKA email 0:14-0:22

- Open the company AI tool on the shared screen. You will type twice, live. Slide 6.

SAY

I'm going to ask the AI to write a delay email two ways. First, the lazy way — the way most people try once, get a rubbish answer, and quietly decide "this thing is overhyped." Watch.

- Type slowly so they can read it: *Write an email about a delayed delivery.* Read the output aloud.

SAY

Listen to this. "Dear Sir, we regret to inform you that your delivery has been delayed. We sincerely apologise for the inconvenience. We value your business. Kind regards." ... It's grammatically perfect. And it's completely dead. There's no PO number, no new date, no plan — nothing the person on the other end can actually do anything with. If I sent that to a supplier, I'd get nothing back. This is the AI most people meet, and then dismiss.

Now watch what happens when I stop asking and start *briefing*. Same tool. Same twenty seconds. I'm just going to tell it who I am, who I'm writing to, and what a good outcome looks like.

- Paste the briefed prompt. Let it generate while you talk over it.

TYPE / PASTE THIS LIVE

You are a procurement lead at VEKA India writing to our PVC profile supplier. Situation: P0-4471 is delayed; our extrusion line needs it by Thursday. Write a short, firm-but-warm email that: names the P0 and batch, gives a revised dispatch window, offers to accept a partial dispatch to keep the line running, and asks for written confirmation by end of day. Under 120 words.

- [read the result aloud, slowly — let the specifics land: the PO, the partial-dispatch offer, the deadline]

SAY

[The punchline — slow down, land it] Same tool. Same twenty seconds. The *only* thing that changed is that I told it who I am, who I'm writing to, and what good looks like. That gap — between the dead email and the one you'd actually send — **that gap is the entire day**. Everything we do from here is just widening your control over that gap. And you'll be doing it yourself in about ten minutes.

The mindset — director & crew 0:22-0:27

- Slide 7.

SAY

One picture to carry all day. You are the **director**. The AI is the **crew**. Now — a film director never walks onto set and asks the crew, "So, um, what should this movie be about?" Right? They'd be fired by lunch. A director describes the shot. "Camera here. Light there. This is the mood. Action." And a good crew makes it happen fast. All day, we are practising describing the shot.

Three rules fall straight out of that. One: **direction beats questions**. "Draft a firm-but-warm reminder to a supplier who's a week late on PO-4471" gets you gold; "write an email" gets you the dead one. Two: **examples beat adjectives**. Instead of arguing with it about tone, paste in one email you liked and say "this style, this length." Show, don't describe. Three, and this is the one people resist: **iteration is the job — it is not a sign you failed**. The first draft is clay. "Shorter. Firmer. Add the PO number. Lose the last line." Thirty seconds of nudging is where all the quality lives. People who get one bad draft and give up are quitting at the exact moment the value starts.

And to whoever's still a little tense about all this — I mean this completely literally: **you cannot break this**. There's no wrong prompt. There's no button that deletes anything. There's only a first attempt that you make better. If you can brief a colleague, you can do this. Let's stop talking about it and prove it — right now, on your work.

ACTIVITY — Your first real win 0:27-0:47

- ▶ Slide 8. Before starting the timer, model it once, live, so nobody's staring at a blank box.

SAY

Before I set you loose, let me do one myself so you see the shape of it. Say I owe my manager a quick update that the new profile die arrived but QC hasn't cleared it yet. Watch me brief it.

- ▶ Type live:
You are helping me, a production supervisor at VEKA India, write a 3-line update to my manager. Situation: the new 70mm profile die arrived today but QC hasn't signed it off yet, expected tomorrow. Tone: calm, factual, no drama. End with when I'll next update them. Read the tidy result.

SAY

See? Thirty seconds, and it's something I'd actually send. Now your turn — and I don't want a pretend example, I want something *real*. Pick one small thing you genuinely owe someone this week. A reminder you've been avoiding. A thank-you. A short update. Anything that's been sitting on your mental to-do list.

Three lanes, on screen. **Core**, everyone: draft that message and give the AI your role, your reader, and the outcome you want. **Scaffold**: if you're not sure how to start, there's a fill-in-the-blanks starter — just replace the brackets, and I promise you that is a professional prompt. **Stretch**: generate it in two different tones and ask the AI which suits your reader better, and why. Pick your lane. You've got twelve minutes on the clock. Off you go.

- Press **T** (12 min). Circulate immediately. Go straight to anyone not typing and point at the Scaffold — don't lecture, just show.

● CORE

Real message, briefed with role + reader + outcome.

● SCAFFOLD

Fill the on-slide starter — it's a full prompt.

● STRETCH

Two tones in one go; ask AI which fits, and why.

⚠ IF IT GOES WRONG → FIX

- **Output too generic** → prompt too vague. "Add one concrete detail — a name, a date, a number." Watch it transform.
- **Too long / stiff** → "Tell it: under 120 words, warmer, cut the throat-clearing at the start."
- **Someone frozen** → walk over, read the Scaffold with them, type the first blank together. Momentum beats instruction.
- **"It's not quite right"** → celebrate that. "Perfect — now tell it the one thing you'd change. That follow-up is the whole skill."

- At ~10 min: "Two minutes — get to something you'd send." At time, take submissions in the chat.

◆ DEBRIEF — say while reviewing outputs

Fantastic. Let me read a couple out — and I want you to listen for the specifics, because that's what makes these work.

[pick one that's concrete] Listen to this one — see how it names the actual person and the actual deadline? That's not a template, that's a real message. Whoever wrote that, take a bow. *[pick one that improved after a follow-up]* And this person told me their first draft was too formal, so they added "warmer, shorter" — and look at the difference. That second instruction is the entire game.

[if one's still generic, be kind] This one's close — it just needs one concrete detail to come alive. Add the PO number or the name and it's done. That's the only muscle we're building today.

- Open **L**; award **Best Prompt of the Hour +3** to a table.

Checkpoint & bridge 0:47-0:55**✓ CHECKPOINT (SLIDE 9)**

Spot-check 3–4 submissions: specific to a real situation · one clear ask · sounds human · improved at least once. If most people have something sendable, Hour 1 is won — move on.

SAY

Take a second and notice what just happened. Twenty minutes ago, some of you had genuinely never used this properly. You just produced something you'd put your own name on and send to a real person. That's the whole game — and we've barely started. In the next hour I'm going to give you the actual *recipe*, so this is never luck again — so you can do it on demand, every time.

HOOR 2 · SLIDES 10-15 · 50 MIN

Anatomy of a great prompt

OBJECTIVE Install C·T·P·F (Context · Tone · Persona · Format) as a permanent tool; prove precision is fewer words aimed better. **VEKA OUTCOME** Everyone can rescue a weak prompt on demand.

Recap & frame 0:00-0:04

SAY

So in the last hour you *felt* the difference a good briefing makes. But feeling it isn't enough — if it's just a feeling, it'll be hit-and-miss. So now I'm going to hand you the actual recipe. Four ingredients. Learn these once and you'll use them for the rest of your working life, in any AI tool that exists now or gets invented next year.

The framework — C·T·P·F 0:04-0:12

- ▶ Slide 11. Introduce each lever with a one-line VEKA example, spoken.

SAY

Four levers. Every strong prompt pulls some combination of these.

Context — the situation and the real, specific details. Not "a delivery is late," but "PO-4471, the seals, our line is waiting, the customer already chased once." The more true detail you give, the less it has to invent. Vague in, vague out.

Tone — say it out loud, don't make it guess. "Firm but respectful." "Warm and apologetic." "Neutral and technical." The same facts written firm versus written warm are two completely different emails, and only you know which one this situation needs.

Persona — who you want the AI to *be*, and who it's writing *to*. "You are a senior VEKA procurement lead writing to a supplier we've worked with for ten years." Watch how that one line changes everything — it stops sounding like a call-centre script and starts sounding like a person with authority.

Format — the shape you want the answer in. An email. Three bullets. A table. A WhatsApp message under fifty words. If you don't say the shape, you get whatever shape it feels like, and it's usually too long.

Here's the memory hook so this sticks: "**Can These Prompts Fly?**" — **Context, Tone, Persona, Format**. And here's the real payoff, the thing I want you to steal forever: whenever an answer disappoints you, don't get frustrated and don't give up. Just ask yourself — which of these four did I leave out? Add it. Run it again. That is the entire troubleshooting method for this technology, and you now know it.

DEMO — one request, four levers, live 0:12-0:19

- ▶ Slide 12. Build it up on the shared screen, re-running after each lever so they watch it sharpen.

SAY

Let me show you the levers stacking up. I'll start with nothing — the bare request.

- ▶ Type: *Write a message about a machine breakdown.* Read the vague result.

SAY

Fine. Useless on the floor, but fine. Now I add **Persona** — "you are a maintenance supervisor at VEKA."

- ▶ Add it, re-run. Then Context: "Extruder 3, seal failure, went down at 2pm, expected back by 6." Re-run. Then Tone: "calm, factual, no blame — we're informing, not apologising." Re-run. Then Format: "a 3-line WhatsApp update to the shift group, plus one line stating the action needed." Re-run.

SAY

Watch what just happened across those four runs. It went from a vague paragraph to something the shift group could act on in ten seconds. And here's the thing I most want you to notice — **[the punchline]** — I never made it *longer*. If anything the final one is shorter. I made it more *directed*. That's the lesson people miss: precision is not more words. Precision is fewer words, aimed better. The bare request was longer and worse.

ACTIVITY — the before/after rescue 0:19-0:34

- Paste the weak prompt into chat: *write something about a price increase to a customer. Slide 13.*

SAY

Now you're the fixer. Here is a genuinely terrible prompt — "write something about a price increase to a customer." Look how much it's *not* telling the AI. Who's the customer? How big an increase? Are we apologising or just informing? What do we want them to do? Your job: rescue it with the four levers, run the before and the after, and keep both open side by side so you can *see* the jump.

Core — rebuild it with all four levers and compare. **Scaffold** — use the four-line template on screen, literally one line per lever; don't overthink it, one good line beats a paragraph. **Stretch** — add a fifth instruction: "give me three versions on a scale from gentlest to firmest," then decide which version you'd send to a brand-new customer versus one you've had for ten years. That judgement — matching the tone to the relationship — that's you being the director. Twelve minutes. Go.

- Press **T** (12 min, incl. share). Circulate.

- **They edit the output, not the prompt** → gently redirect: "Fix the *instructions*, not the answer. Editing one answer helps today; fixing the prompt helps forever."
- **All four levers but bloated** → "Great — now cut the prompt itself by a third and keep the quality. Precision, remember."
- **Stuck on tone words** → "Don't describe the tone — paste an example of an email you liked and say 'match this.'"

◆ **DEBRIEF — say while reviewing outputs**

Post your before and after. Let me read one pair... *[read a weak "before" then its "after"]* Hear that? The before could be from any company on earth. The after knows it's VEKA, knows the customer, knows exactly what it's asking. Same person wrote both, four minutes apart. That's not talent — that's the four levers.

[find a Stretch] Somebody did the three-versions Stretch — read me your firmest and your gentlest... lovely. And which would you send to a ten-year customer? ... Exactly. See how you're not just generating now — you're *choosing*. That's the leadership muscle.

PROMPT BATTLE #1 — fewest words, best email 0:34-0:44

- ▶ Slide 14. Bring the energy up — this is a game.

SAY

Right — time for a bit of sport, because you've earned it. One scenario for everyone: a polite-but-final payment reminder to a distributor who is forty-five days overdue. The numbers are invented, don't worry. Two rules. One, you get ninety seconds to write your prompt. Two — and this is the twist — your *prompt* cannot be longer than sixty words. Precision, under pressure.

We're going to score the *output*, not the prompt: is it crystal clear, is it the right amount of firm — not rude, not a pushover — and does it name a concrete next step, an amount, a date? Tables, confer for ten seconds on your strategy... and... ninety seconds starts now.

- ▶ Press **T** (90 sec via a short timer / count down verbally). At time, read two entries aloud; room votes by hands or chat. Winning table **+5**. *[One round only — you're solo. Don't run heats.]*

◆ **DEBRIEF — say while reviewing outputs**

Two finalists. *[read A]* ... *[read B]* ... Okay — hands up for A... hands up for B. *[declare]* The winner nailed the hardest bit: it stayed *warm* while being *final*. That's the tightrope every collections email walks, and they did it in a sixty-word prompt. Five points, that table. Beautifully done.

Checkpoint & break 0:44-0:50

✓ **CHECKPOINT (SLIDE 15)**

Cold-call the four levers from memory. Then: "point to the exact line each lever changed in your rescue." If they can point, it stuck.

SAY

Quick check before the break — shout them out with me: Context... Tone... Persona... Format. "Can These Prompts Fly." You've now got the recipe. Ten-minute break — stretch, water, chai. When you come back, we take this recipe and point it at the three emails that actually keep this plant running, where a badly-worded message costs real money.

SAY

[Break — slide 16] Ten minutes. Back at [time]. Go.

HOUR 3 · SLIDES 17-24 · 55 MIN

High-stakes writing

OBJECTIVE Apply prompting to vendor negotiation, shift handover, delay/crisis comms. Produce one reusable, hand-off-ready artefact. **VEKA OUTCOME** Three real drafts; one a colleague could reuse with no edits.

Recap & why these three 0:00-0:06

- ▶ Slide 17→18. Bring them back in with energy.

SAY

Welcome back. Quick recap: Hour 1, you felt the difference. Hour 2, you learned the recipe — the four levers. Everything so far has been warm-up on relatively safe writing. Now we point all of it at the emails that carry real *risk* — the ones where the wording, the tone, and the speed decide whether a small problem stays small or turns into a lost customer or a burned supplier.

There are three of these in a manufacturing business, and you write versions of them constantly. **Vendor negotiation** — where you have to hold your position without setting fire to a relationship you depend on. **Shift handover** — where the whole risk is that something true and important falls into the gap between one shift and the next. And **delay and crisis communication** — telling a customer bad news in a way that actually keeps their trust instead of destroying it.

And before we build the crisis one, let me give you a golden rule — write it somewhere you'll see it: **in a crisis email, lead with the fact and the fix — never the apology.** The instinct is to open with three sentences of "we're so terribly sorry."

Resist it. "Your order now dispatches Thursday; here's the partial we can send you tomorrow to keep your site moving" — that opening beats any amount of sorry, because it respects the reader's time and gives them something to *do*. Let's build all three.

ACTIVITY — vendor negotiation 0:06-0:16

- ▶ Slide 19.

SAY

First scenario. One of your profile-compound suppliers has come back to you mid-contract asking for a seven percent price increase. Invented, but it happens all the time. You can't just say yes — that's your margin. And you can't just say a flat no and slam the door — you need these people. This is a negotiation, in writing.

Core — write a reply that does three things in order: acknowledge that their costs are real so they feel heard, hold firm on the contracted price for the current term, and offer *one* constructive alternative — a staggered increase later, a longer contract, a bigger volume commitment. **Scaffold** — the template on screen already has that three-part structure built in; you just drop in the specifics. **Stretch** — here's a genuinely powerful move: after it writes your email, ask it to also write the supplier's *most likely counter-reply*, and then draft your response to *that*. You've now rehearsed the whole negotiation before you've sent a single message. Nine minutes.

► Press **T** (9 min).

- **It caves on price or turns aggressive** → "Tell it explicitly: do not concede the price, and do not threaten. Offer a trade instead of a fight."
- **Too soft / no ask** → "Add: end with a clear, specific proposal they can say yes or no to."

◆ **DEBRIEF — say while reviewing outputs**

[read one that offered a smart trade] Listen to the alternative this one offered — a longer term in exchange for holding the price. That's not just a nice email, that's a *negotiating position*. The AI didn't invent that strategy — the writer did, and the AI made it sound polished and senior. That's exactly the division of labour: you bring the judgement, it brings the polish and the speed.

ACTIVITY — shift handover 0:16-0:26

► Slide 20. Paste synthetic shift notes into chat.

PASTE THESE MESSY NOTES INTO CHAT

```
extruder 2 running slow since afternoon
changed filter around 3pm, seems better
P0-4471 white profiles on hold, waiting QC sign-off
night shift priority = white 70mm order
coolant topped up, level was low
```

SAY

Second one, and this is the one I'd bet most useful to the floor. End of B-shift. The next team walks in and they need to inherit *reality* — not guess, not ring you at home, not discover at 11pm that something was on hold. So we turn rough, half-sentence notes into a clean, scannable handover.

I've dropped some deliberately messy notes in the chat — grab them. **Core** — feed those notes in and get a structured handover back. **Scaffold** — use the template; it forces four fixed headings: Line Status, Actions Taken This Shift, Watch-outs, and Priority For Next Shift. **Stretch** — this is the clever one — turn it into a reusable *format* with those exact headings, so that from now on *every* handover on your line looks identical. When every handover has the same shape, a brand-new operator can read one and know exactly where to look. That, quietly, is the beginning of an SOP — and we'll come back to that idea this afternoon. Eight minutes.

► Press **T** (8 min).

- **It invents detail not in the notes** → the teachable moment: "Tell it — use only the notes I gave you; if something's unknown, write 'not reported.' Never let it fill gaps with fiction on a shop floor."
- **Headings inconsistent run-to-run** → "Give it the exact four headings in the prompt so it can't drift."

◆ **DEBRIEF — say while reviewing outputs**

[read a clean one] Look how fast your eye finds the important thing — the QC hold jumps out, the night priority is right there. Compare that to a wall of text at end of shift when everyone's tired. *[if someone did the reusable format]* And this person built the fixed-heading version — that's not a handover any more, that's a *system*. Would you mind if we put that one forward for the whole line to adopt? That's the difference between doing your job and improving everyone's.

ACTIVITY — delay & crisis comms 0:26-0:38

► Slide 21.

SAY

Third and highest-stakes. A transporter has broken down. A distributor's order is going to be two days late, and they've got their own site waiting. This is the message where our golden rule earns its keep.

Core — fact, then fix, then reassurance, in that exact order, and give them a concrete option: a partial dispatch, a firm revised slot, your direct number. **Scaffold** — the template sequences it for you, so you physically cannot bury the new date under three paragraphs of apology. **Stretch** — write three versions calibrated to how much the relationship is worth: your biggest key account gets the most proactive one, maybe with an offer to call them personally; a standard account gets the solid version; a brand-new customer gets extra reassurance because they don't trust us yet. Same facts — different level of care. That's personalisation, and we'll go deeper on it after lunch. Nine minutes.

- ▶ Press **T** (9 min). Afterwards, deliberately read one "sorry-first" and one "fact-first" version back to back.

◆ **DEBRIEF — say while reviewing outputs**

I want to do something with two of these. Here's a "sorry-first" one... *[read it — the apology-heavy open]* ...and here's a "fact-first" one... *[read the fact-then-fix open]*. Now — everyone, honestly — as the *customer* waiting on that order, which one do you trust more? *[let them answer]* Right. The fact-first one. Because it treats you like a professional with a problem to solve, not someone to be soothed. That's the whole golden rule in one comparison. Award Best Prompt of the Hour to the strongest crisis note.

- ▶ Open **L**; award +3.

Checkpoint & lunch 0:38-0:55

✓ **CHECKPOINT (SLIDES 22-24)**

Table buddies swap handovers, check the four fixed headings. All three artefacts exist; at least one is reusable with zero editing.

SAY

That's Phase One complete. Take a breath and realise what you can now do: you can sit down and, in a couple of minutes, produce a vendor negotiation, a clean handover, and a crisis message that a colleague could reuse without touching a word. This morning some of you were nervous about typing a prompt. Well done — genuinely.

[Lunch — slide 25] Now — forty-five minutes for lunch. Recharge properly. When we come back, we put the writing aside and go after the *data* — Tally, SAP, your SOPs, your maintenance logs. This is where the people who work with numbers all day are going to have a very good afternoon. See you at [time].

HOURL 4 · SLIDES 26-32 · 55 MIN

Finance & Operations

OBJECTIVE Use AI as a first-pass analyst beside SAP/Tally — reconcile, standardise SOPs, mine maintenance logs. Cement the synthetic-data habit. **VEKA OUTCOME** A reconciliation summary, an SOP, and a maintenance insight — all defensible against the source data.

Welcome back & the principle 0:00-0:05

- ▶ Slide 26→27. Re-energise a post-lunch room — stand, move, maybe a quick "who had the good thali."

SAY

Welcome back — I know, the post-lunch slump is real, so we're going to keep moving and keep your hands busy. Big shift this afternoon: we're done with writing emails, we're going to work with *data*. Tally exports, SAP data, maintenance logs, SOPs.

And I need to kill a fear before it even starts, because I can see one or two of you already worried. AI is *not* here to replace SAP or Tally. Let me say that again — your systems of record stay exactly where they are. They are still the truth. AI is a *layer that sits next to them*. It reads the messy export you pull out, it explains it in plain language, it drafts the summary you dread writing, and it catches the thing your eyes slide past at six in the evening. It is not your auditor and it is not your source of truth. It's your fastest first-pass analyst. *You* still sign off. Always. Nobody in this room is handing their judgement to a machine today.

The data-safety rule 0:05-0:08

- ▶ State this clearly and hold it all afternoon. Non-negotiable.

SAY

One hard rule for the entire afternoon, and I'm going to be strict about this one because it matters: **synthetic or masked data only**. That means no real customer names, no real salary figures, no live financials pasted into any AI tool — not even our company account. I'm going to give you fake data that has the exact same *shape* as the real thing — a ledger that looks like your ledger, a log that looks like your log. The technique you learn on the fake data is identical to what you'll do back at your desk on the real data, inside approved systems. But today, in a training room, we practise the safe habit. If you catch yourself about to paste something real — stop, and use my fake version instead. Clear? Good.

DEMO — messy ledger → clean summary 0:08-0:17

- ▶ Slide 28. Paste the synthetic vendor ledger (~15 rows; two duplicate rows, one invoice≠paid mismatch, one currency-symbol typo). Ask for totals, mismatches by row, duplicates, and a 3-line manager summary.

SAY

Let me show you the one that makes finance folks sit up. Here's a vendor ledger — fifteen rows, invoices and payments, dates. To your eye at the end of a long day, this is just... a wall. Somewhere in here there's a mismatch and a couple of duplicates, and finding them by hand is exactly the forty minutes of squinting you hate. Watch.

- ▶ [paste, let it run, then read what it found]

SAY

There. Totals invoiced versus paid. The mismatch — and notice it told me the *row number*, so I can go check it myself, I'm not just trusting it blindly. The two duplicates. And a plain three-line summary I could paste straight into an email to my manager. **[The reveal]** It did not do your job. It did the forty minutes of squinting *before* your job. You get to start where the actual thinking begins — at "okay, why is row 7 wrong," not at "where is the problem."

- ▶ If it silently "corrected" the typo instead of flagging it, seize the moment:

SAY

[If it hid the typo] And look at this — it quietly "fixed" a number instead of flagging it to me. That is *exactly* the trap I want you to see. A tool that's too eager to help can hide your errors under a smile. That is precisely why, in a moment, you're going to give it the instruction: "flag it, don't fix it." You stay in control of what's true.

ACTIVITY — reconciliation & reporting 0:17-0:28

- ▶ Slide 29. Point them at the ledger in chat.

SAY

Your turn on the same ledger. **Core** — get the totals, then every mismatch and every suspected duplicate cited *by row number*, then a three-line summary a manager could read in ten seconds. And critically, tell it: if a value looks like a typo, *flag* it — do not silently correct it. **Scaffold** — the template has all of that; paste the data underneath it. **Stretch** — ask for the output as a clean table with columns Row, Issue, Amount, Action; and then tell me which single check you'd automate first if this ran every week. First person to correctly flag the currency typo, call it out — that's two points. Eleven minutes.

- ▶ Press **T** (11 min). Circulate — this is where semi-technical folks shine; let them help neighbours.

- **Invents figures** → "Tell it: only use the rows I gave you, and cite the row for every single claim. No row number, no claim."
- **Table won't render** → "Paste the data as plain text with a `|` between each column — every tool handles that."

◆ **DEBRIEF** — say while reviewing outputs

Who caught the typo? *[award +2]* There it is. Now — how many of you would've spotted that by hand at 6pm on a Friday? Be honest. *[laughter]* Right. That's the point. *[read one good summary]* And listen to this three-line summary — that's manager-ready. The person who wrote the prompt didn't write that summary; they *directed* it. Forty minutes of work, done in one, and you still check the rows it cited. That's the afternoon in a nutshell.

ACTIVITY — SOP standardisation 0:28-0:38

► Slide 30.

SAY

Next — SOPs. Every plant has processes that live entirely in one experienced person's head, and everyone panics when that person's on leave. Let's get one out of the head and onto paper, properly. Think of a routine *you* own — a colour changeover on the line, a start-up check, anything.

Core — describe it in a few messy sentences, exactly how you'd explain it to a new colleague, and get back a clean numbered SOP with a safety note and — this is the important bit — a "done when" line. **Scaffold** — the template gives you the standard skeleton: Purpose, Who Does This, Materials, Steps, Safety Checks, Done When.

Stretch — ask it to also write a five-question competency check, so you can confirm a new operator actually *learned* the SOP rather than just nodded at it.

And let me flag the hardest part, because it's the most valuable: that "**done when**" line. Anyone can list steps. Stating clearly how you *know* you've finished correctly — the right colour with no streaks, pressure back in range — that's what separates a real SOP from a to-do list. Ten minutes.

► Press **T** (10 min).

- **Vague steps** → "Rewrite every step as a single 'Do X' instruction — one action per line."

◆ **DEBRIEF — say while reviewing outputs**

Read me your "done when" line — just that line. *[take 2-3]* Hear how specific those are? That's the line that stops a night-shift newcomer from guessing. You just turned tribal knowledge into something teachable in ten minutes.

ACTIVITY — maintenance-log analysis 0:38-0:49

- ▶ Slide 31. Paste the synthetic maintenance log (~20 lines; one machine clearly worst by downtime; one repeated issue type).

SAY

Last build of the hour, and it's a good one for the operations and maintenance folks. A month of breakdown entries is sitting in the chat — machine, date, issue, downtime. Buried in there is a pattern that would let you plan instead of firefight, but nobody has time to eyeball a month of logs.

Core — ask for the top three recurring issue types, the machine with the most total downtime, and one preventive action worth trialling. **Scaffold** — template's there, paste the log under it. **Stretch** — ask it to rank problems by downtime *times* frequency — because a quick fault that happens twenty times can hurt more than a big one that happened once — and give you a one-line business case for the single fix worth doing first. And insist it cites the numbers it used, so you can trust the conclusion. Nine minutes.

- ▶ Press **T** (9 min).

◆ **DEBRIEF — say while reviewing outputs**

Which machine turned out to be the quiet villain? *[take answers]* And did anyone's Stretch surface a fault that's individually small but adds up to real downtime? *[if yes]* That's the insight you'd never get from gut feel — that's the log *telling* you where to spend your maintenance budget. You just did in nine minutes what usually never gets done at all.

Checkpoint & bridge 0:49-0:55

✓ **CHECKPOINT (SLIDE 32)**

Reconciliation cites rows (no invented numbers) · SOP has a "done when" · insight backed by log figures · synthetic data used throughout.

SAY

Look at your screens — a reconciliation, an SOP, and a maintenance insight, all in under an hour, all defensible against the actual data. That's Phase Two, the functional side, well underway. Next hour we stay hands-on but swing over to the people who sell our profiles and the people who hire and look after our teams — sales and HR.

HOUR 5 · SLIDES 33-40 · 50 MIN

Sales & HR

OBJECTIVE Personalisation at scale — one profile pitched to different buyers; accurate JDs and plain policy without invented facts. **VEKA OUTCOME** Two genuinely differentiated pitches + a publishable JD or policy clause.

The principle — real personalisation 0:00-0:06

► Slide 33→34.

SAY

This hour is for the money side and the people side — sales and HR — and they share one big idea: **personalisation at scale**. The same product, or the same policy, shaped for the exact human in front of you. AI lets one salesperson write like they've got all afternoon for every single lead, and lets one HR person turn around an accurate technical document without waiting three days for engineering to reply.

But here's the trap, and it's the whole lesson of the hour: **generic personalisation is worse than no personalisation**. We've all had the email that says "Dear [First Name], as a valued customer..." — it's insulting, because it's pretending. Sticking someone's name at the top is *not* personalisation. Real personalisation puts the buyer's *world* into the message — their project, their pressure, the objection they're already forming in their head. Give the AI that world, and it writes something that lands. Give it just a name, and you've automated the thing everyone hates.

ACTIVITY — the same profile, two buyers 0:06-0:16

► Slide 35.

SAY

Let's prove it. Take our 70mm PVC window profile — one product. You're going to pitch it to two completely different buyers and watch the same product bend to fit each one.

Buyer one: an **architect**. They care about thermal performance, how it looks, the certifications, the design story. Buyer two: a **volume builder**. They could not care less about the design story — they care about lead time, price per unit, and how fast their crew can install it. **Core** — write one short pitch to each, and lead with the *one* thing that buyer cares about most. **Scaffold** — use the template twice, changing only the buyer block; feel how much the message shifts. **Stretch** — add the objection you know is coming — "imported profiles are cheaper" — and have the AI handle it *inside* the pitch, smoothly, before they even raise it. Ten minutes.

► Press **T** (10 min).

- **Both pitches read the same** → "Lead each with a *different* single benefit — don't just reshuffle the same paragraph. The architect's first line and the builder's first line should barely overlap."

◆ **DEBRIEF — say while reviewing outputs**

I want to hear one person's two pitches, back to back. [*have someone read architect then builder*] Listen to how different the *opening line* is — one leads with thermal and design, the other leads with "on site in three weeks, priced per metre." Same profile. Completely different message. *That's* personalisation — not the name at the top, the world in the body. Whoever pre-empted the imports objection, read me that bit... gorgeous. You just answered the question before they asked it, which is what your best salespeople do instinctively.

ACTIVITY — lead-generation outreach 0:16-0:24

► Slide 36.

SAY

Now the cold first-touch — the message to a fabricator or dealer who's never heard from us. The graveyard of sales is the ignored cold email, and it's almost always because it opens by talking about *us*. "We at VEKA are a leading manufacturer of..." — delete. **Core** — four short lines, no more: open with something relevant to *their* business, one line on why VEKA specifically fits *them*, and one low-effort ask — a sample, a fifteen-minute call. **Scaffold** — the template keeps you short and reader-first, the two things cold outreach always fails at. **Stretch** — build a three-message sequence: the first touch, a gentle nudge four days later, and a final value-add on day nine, so no promising lead ever goes cold just because you got busy. And please — ban "I hope this email finds you well." Eight minutes.

► Press **T** (8 min).

◆ **DEBRIEF — say while reviewing outputs**

Read me just your opening line — only the first line. [*rapid-fire 4-5 of them*] The good ones there all had one thing in common — they were about the *reader*, not about us. If your opener would make a busy dealer pause for one second instead of deleting, it's working. That's a reply you wouldn't have got.

ACTIVITY — technical JD + policy clause 0:24-0:33

► Slide 37. *This is the HR-forward activity — make sure non-sales folks feel centre-stage here.*

SAY

HR, this one's yours especially. Two jobs. First, draft a technical job description — say, an Extrusion Line Technician — without having to chase engineering for a week to get the wording right. **Core** — get a JD with role purpose, five to seven key responsibilities, must-have skills, nice-to-haves, and who they report to, specific to PVC profile manufacturing. **Scaffold** — template prompts you for the few specifics that stop it inventing nonsense. **Stretch** — then draft a short leave-policy clause, and ask it to rewrite that clause at a Grade-8 reading level and flag any sentence that could be read two different ways, then fix them.

Now, the single most important instruction for this one — write it down: **do not let it invent facts**. If it's not sure whether a certification is required, it must write "confirm with plant lead" in brackets, not make something up. An honest gap is useful; a confident fabrication in a job description or a policy is dangerous. Nine minutes.

► Press **T** (9 min).

- **Invents certifications / requirements** → "Tell it: don't fabricate anything; mark unknowns as '[confirm]'." Point out where it guessed.

◆ **DEBRIEF — say while reviewing outputs**

Which JD line would actually make a good technician think "that's me, I should apply"? *[take a couple]* And did anyone catch it inventing a certification? *[if yes]* Good — you caught it, and you told it to mark it "confirm" instead. That habit — trust but verify, make it flag its own guesses — that's what keeps you safe when you use this for real.

PROMPT BATTLE #2 — sell it in six lines **0:33-0:41**

► Slide 38.

SAY

Second sport of the day. Scenario: a prospect wanders in, half-interested — "I'm just browsing profiles, having a look." Your mission: turn that into a booked sample request. The catch — your output has to be six lines or fewer. Short and deadly. Ninety seconds to write your prompt. We score on relevance to that specific buyer, a genuine reason to act now rather than "later," and one clear next step. And two bonus points if it quietly handles an objection along the way. Tables ready? Ninety seconds... go.

► Press **T**. Read two, vote, winner **+5**, objection bonus **+2**.

Checkpoint & break 0:41-0:50

✓ CHECKPOINT (SLIDES 39-40)

Two pitches that differ in *lead benefit* · outreach short and reader-first · JD/policy with no invented facts.

SAY

That's Phase Two done — the functional mastery across finance, ops, sales and HR.
[Break — slide 41] Ten-minute break. When you come back, we stop making one-off prompts and start building *assets* — the templates your whole department reuses. This is the part where you stop being a user and start looking like a leader.
Back at [time].

HOUR 6 · SLIDES 42-48 · 50 MIN

From prompt to asset

OBJECTIVE Turn a winning prompt into a parameterised, guard-railed template and file it as a VEKA Prompt Library card. **VEKA OUTCOME** One finished library card a colleague could use cold.

The leap — prompt vs asset 0:00-0:07

► Slide 42→43.

SAY

Welcome back. Everything you've built today has been *personal* — your prompt, your win, on your screen. This hour we make it *scale*, and that's the move that changes how your manager sees you.

Here's the problem with a brilliant one-off prompt: if you're the only person who can write the good crisis email, then you're not an asset — you're a bottleneck. You go on leave, the quality drops. But if you can hand your prompt to ten colleagues and they all produce your quality — now you've built something that outlives your Tuesday.

And the trick to get there is genuinely simple. Take a prompt that worked. Look at it and ask: what changes every time I use this? The customer name, the date, the reason — those become **bracketed slots**, blanks to fill in. And what *stays the same* — the tone, the structure, the little quality checks — that stays locked in place. That's the entire difference between a one-off prompt and a reusable template: variables you fill, structure you keep.

DEMO — a prompt becomes a template 0:07-0:14

► Slide 44. On the shared screen, take the Hour-3 crisis prompt and convert it live.

SAY

Let me do it live with the crisis email from before lunch. Here's the working prompt. Now I hunt for what changes every time.

► Live, replace the specifics: the delay reason becomes `[DELAY_REASON]`, the new date becomes `[NEW_DATE]`, the account importance becomes `[CUSTOMER_TIER]`. Keep the tone and format sentences untouched. Add a one-line usage note at the top.

SAY

Look at what I've got now. Three blanks, and everything that made the email good — fact-first, the partial-dispatch offer, the calm tone — is locked in. **[The reveal]** I just stopped being the only person who can write this email. Anyone on the team drops in three values and sends a great message. That is not a prompt any more. *That's a process.* And a process is exactly the thing a Head of Department gets genuinely excited about, because it means consistent quality without depending on any one person's Tuesday-afternoon mood.

ACTIVITY — build your department template 0:14-0:29

► Slide 45.

SAY

Your turn to build one. Pick your best prompt from today — whichever landed hardest, the crisis email, the handover, the pitch, the reconciliation — and turn it into a clean, reusable template. **Core** — find every part that changes each time, wrap it in brackets, give the template a short findable name, and write a one-line "how to use this." **Scaffold** — use the meta-prompt on screen; the AI will actually help you spot your own variables and format it. **Stretch** — add one or two *guardrails* so it fails safely — like "never invent a date; if it's missing, ask me" — and include one filled-in example so a newcomer sees it in action. Twelve minutes. This one's worth doing well — it's the thing you'll still be using in six months.

► Press **T** (12 min).

- **Brackets everything, prompt loses its spine** → "Only variable-ise the *facts*. Keep the instructions that made it good — those are the point."
- **No guardrail** → "Add one line telling it what *not* to do. That's what makes it safe for a colleague to run unsupervised."

◆ DEBRIEF — say while reviewing outputs

Read me your template's name and its one-line use-note. *[take several — fast]* Hear how clear those are? "Late-supplier chaser — use when a PO slips past its due date." A colleague reads that and knows instantly when to reach for it. A template nobody can find or understand isn't an asset, it's a buried file. You've just written findable, reusable tools.

ACTIVITY — file a VEKA Prompt Library card 0:29-0:41

► Slide 46→47.

SAY

Now let's make it official, and real. We are seeding an actual, shared VEKA Prompt Library right now, in this room — and the whole reason libraries work is that every entry is documented the same way, so anyone can pick any card up cold. So take your template and pour it into the card format on screen: name, department, what it does, when to use it, the template itself, and one worked example with fake values.

Core — fill every field. **Scaffold** — the exact format's on the slide, just complete it.

Stretch — rate your own template out of five for reuse potential and note the one improvement you'd make with more time; future-you will thank you. Every card that makes the cut earns your table two points and — this is the real prize — a permanent place in the library. Which means the next new joiner in your department, on their very first day, inherits the best thinking of everyone in this room. Nine minutes.

- Press **T** (9 min). Collect accepted cards into a shared doc as you go.

Checkpoint & bridge 0:41-0:50

✓ CHECKPOINT (SLIDE 48)

A colleague could run the card with zero explanation from you. That's the whole test.

SAY

That's Phase Three — the leadership move. You've gone from "I can write a good prompt" to "I've built a tool my whole team can use." *[energy up]* And now — the main event. Everything today has been building your toolkit. In the next hour you're going to point that toolkit at a real, annoying problem in your own job, and build a working solution to it. This is the capstone. Let's go.

HOUR 7 · SLIDES 49-55 · 70 MIN

Capstone sprint

OBJECTIVE Identify a real bottleneck; build a working, tested solution + a rehearsed 90-second demo. **VEKA OUTCOME** A demonstrable fix to a genuine VEKA bottleneck, ready to hand to an HOD.

The brief & scope discipline 0:00-0:11

- ▶ Slide 49→50. This sets up the whole hour — make it feel like the main event, not another exercise.

SAY

Alright — this is what the whole day has been building towards. For the next hour, you are going to solve a real problem in your own job. Not a case study, not my example — *your* bottleneck. Pick one repetitive, manual, dull, rules-based thing you do every single week, and build the AI solution that kills it. And at the end, you'll demo it to the room.

Now let me give you the one piece of advice that decides who has a great capstone and who struggles: **scope small**. One sharp, finished solution beats three vague, half-built ideas every time. "Auto-draft my Monday supplier chasers" — brilliant, finishable, demoable. "Transform the entire procurement function" — you'll still be scoping it when the timer goes. So think small and specific. What's the thing you groan about every Monday? Start there.

Three phases: **identify** the bottleneck precisely, **build** the solution and test it on fake data until it's reliable, and **prove** it with a clear before-and-after. That before/after contrast is your demo — "this used to take me forty minutes; watch it take one." Let's start by pinning it down.

Step 1 — pin the bottleneck 0:11-0:19

- ▶ Slide 51.

SAY

Before you build anything, name the problem precisely — because a well-defined problem is half-solved. Use the little canvas on screen and answer four things: what's the task, how often do you do it, how long does it take you now, and what does a genuinely great result look like? **Core** — answer those four in a short paragraph. **Scaffold** — the prompt on screen will interview you through it and even tell you if your scope is too big to finish in half an hour. **Stretch** — put a number on it: if this worked, how many hours a week would it save across your team? Hold onto that number — it's your headline in the showcase. Eight minutes. Don't build yet — just scope.

- ▶ Press **T** (8 min). Circulate hard here — a good scope saves the whole hour. Anyone too broad, use the slide's "help me narrow it."

◆ **DEBRIEF — say while reviewing outputs**

Give me your one-line pitch — "I'm killing ___, which eats ___ hours a week." [*rapid-fire around a few tables*] Those are great, and they're all *specific*. Notice nobody said "improve everything." The sharp ones are the ones that'll actually get built in the next half hour. If yours still feels big, grab me now and we'll trim it before you start.

Step 2 — build & test (DEEP WORK) 0:19-0:44

- ▶ Slide 52. This is the heart of the day — 25 quiet minutes. Announce it as focus time so the room doesn't wait on you.

SAY

Now, heads down. This is your twenty-five minutes of quiet focus time — the most valuable block of the day. Build your prompt or template, run it on fake data, watch where it breaks, fix it, run it again. Test it at least three times, because a solution that works once and fails twice isn't a solution. And reuse everything from today — the reconciliation structure, the handover format, the template pattern from last hour are all fair game to adapt; you're not starting from a blank page.

I'll be walking the room the whole time, so if you get stuck, put a hand up — I'll come to you. And here's a deal: if you help the person next to you get unstuck, *they* earn a point and you earn my genuine gratitude. The best learning in this room for the next twenty-five minutes will be you teaching each other. Okay — twenty-five minutes. Go build something.

- ▶ Press **T** (25 min). Lap the room every ~7 min; prioritise anyone not typing. Common rescues: inconsistent output → add a fixed output format; invents facts → "use only what I provide, ask if missing"; too generic → add persona + one concrete example; multi-step task → split into two prompts (extract, then summarise).

SAY

[At ~10 min in, over the room, encouraging] Great energy in here. If your first version is rough — perfect, that's exactly where you should be. Now tell it the *one* thing that's wrong and run it again. *[At ~20 min]* Five minutes on the build — start getting it to a state you could show, even if it's not perfect. Done and demoable beats perfect and private.

Step 3 — polish & prep the 90-second demo 0:44-0:53

- ▶ Slide 54.

SAY

Last stretch before we show off. A great solution with a flat, rambling demo loses to a simple solution with a sharp one — so let's build your moment. You'll get ninety seconds each. Prepare exactly four things: the problem in *one* sentence; what you'll run live; your before-and-after punchline — the time saved or the quality jump; and your answer to the one hard question I might ask — "where does a human still need to check this?" That last one is crucial: answering it confidently makes you look wise, not naïve. Nobody trusts someone who claims the AI is perfect.

Core — jot those four down. **Scaffold** — the prompt on screen will write your demo script for you from your solution. **Stretch** — rehearse it once, out loud, to your neighbour, and time it. If your punchline lands on one tired colleague at 4pm, it'll land on the room. Nine minutes.

- ▶ Press **T** (9 min). Use the deck's built-in buffer (min 53-63) to catch stragglers rather than extending everyone's clock.

Checkpoint 0:63-0:70**✓ CHECKPOINT (SLIDE 55)**

It runs live on synthetic input with no hand-editing of the output · demo fits in 90 seconds. If it only "works" after they edit the result by hand, it's not finished — help them add the missing instruction so the AI does it.

SAY

Everybody should now have a working solution and a ninety-second demo ready. Take a breath — you just did, in one hour, what most people mean when they say "we should really automate that someday." You didn't say someday. You built it. Now let's show the room.

HOUR 8 · SLIDES 56-62 · 30 MIN

Showcase & sustainability

OBJECTIVE Celebrate, judge, and convert the day into something that survives Monday. **VEKA OUTCOME** Winners named, solutions harvested to the library, everyone leaves with a written 30-day plan.

The showcase 0:00-0:14

- ▶ Slide 57. High energy. Keep time hard — 90 sec each; one per table if the room is large.

SAY

This is my favourite part of the entire day. You built real things — now show them off, and let's celebrate them. Ninety seconds each, and I'm going to be strict on time, because that constraint is a gift — it forces you to lead with what matters. The problem in one line, run it live, hit us with the before-and-after. Who's brave enough to go first? ... *[warm, encouraging]* Come on — first one's the hardest and you've already done the hard part.

- ▶ Judge each 1-5 on the rubric (Appendix A). Give the three biggest "oh" reactions an audience bonus +3. Harvest every strong solution into the library on the spot.

♦ DEBRIEF — say while reviewing outputs

[after each demo — vary these] That's a real one — you'll use that on Monday. ... Notice the before/after there: forty minutes to ninety seconds. That's a day a week back over a year. ... And I love that you answered where the human still checks — that's exactly right, you're using it, not trusting it blindly. ... Give them a hand.

Leaderboard finale 0:14-0:17

- ▶ Slide 58. Open . Everyone who demoed +5; top capstone +10.

SAY

Let's see the final board. Everyone who just stood up and demoed — that's five points each, you earned every one. And our top capstone, by the judging and by the room's reaction... *[drum roll on the table]* ...gets ten. Give them a proper hand. And honestly — look at that board. What this room designed and built in a single day is what most companies are still holding meetings *about*. You didn't talk about it. You did it.

Sustainability — how this survives Monday 0:17-0:24

- ▶ Slides 59–60. Shift from celebration to the honest, grounding close.

SAY

Now the honest part, because I'd be doing you a disservice if I let you walk out on a high and forget all of it by Friday. Here's how today lives on, in three pieces.

One — the VEKA Prompt Library. The one we started today is real, and it stays. The best templates get curated in, tagged by department — Finance, Sales, Operations, HR — so the quality doesn't walk out the door when people are busy or move on. Each department should pick one steward to keep it tidy, because a library with no gardener quietly turns into a junk drawer.

Two — your HODs. Your department heads are going to review these capstones and pick the strongest ones to put straight into daily workflows — automating the SAP data cleaning, the recurring reports, whatever's ripe. That's the whole point of today: it moves from a "training exercise" to a real business tool that saves real hours.

Three — this isn't the end. There's a follow-up to map what you need next, because this technology is moving fast and we intend to keep VEKA ahead of it, well beyond 2026. Today was the beginning, not the whole story.

ACTIVITY — your 30-day plan 0:24-0:29

- ▶ Slide 61. The most important five minutes for retention — don't let it get rushed by an over-running showcase.

SAY

Last thing, and it matters more than anything else today, so give it your full attention. Here's the hard truth about any skill: if you don't use it for thirty days, it evaporates. Completely. So you are not leaving here with inspiration — inspiration fades by the car park. You're leaving with a *plan*.

Four lines, on the sheet. One habit you'll start *this Monday* — small and specific, "draft my Monday supplier chasers," not "use AI more." One template you'll share, and exactly who you'll give it to. One colleague you'll teach. And one number you'll track to prove to yourself it worked, with a date to check it. Keep it small enough that a busy week can't kill it. Five minutes — write it for real.

- ▶ Press **T** (8 min). Then have several people say one commitment aloud.

Close 0:29-0:30

- ▶ Slide 62. Land the plane with warmth and a clear last image.

SAY

Look at where you started this morning — some of you genuinely nervous about typing a single prompt — and look at where you are now. You didn't learn *about* AI today. You *used* it. You've got real drafts, templates sitting in the VEKA library, a working capstone, and a plan on your desk for Monday morning.

So before you go, I want one thing from each of you — not applause, a commitment. Say one thing out loud that you will do differently starting Monday. Just one. Because the commitments we say out loud, in a room, in front of people — those are the ones that actually get kept. Who wants to start us off? ... *[take several, warmly]* ... Wonderful. That's exactly it.

Thank you, all of you — you were a genuinely brilliant room to build with, and I don't say that every time. Now go and make Monday faster. See you out there.

APPENDIX

The answer bank — scripted responses

Bookmark this. These are the questions that come up in almost every session. Answers are written to say aloud — calm, honest, confident.

Q Is this going to replace my job?

A Fair question, and I'll give you a straight answer. This replaces *tasks*, not people — specifically the repetitive, low-judgement tasks you probably don't enjoy anyway. The people who do well with this aren't the ones it replaces; they're the ones who use it to get the boring 40% of their week back and spend it on the work only a human can do. Today you're becoming that person.

Q What if it gives me a wrong answer?

A It will, sometimes — confidently. That's exactly why the whole day we've said: you sign off, not the AI. Treat it like a fast, bright intern whose work you always check. Notice we built "cite the row," "flag don't fix," and "mark unknowns to confirm" into our prompts — those are your safety rails. You verify; it accelerates.

Q Which tool should I actually use?

A Use the one VEKA has given you a company account for — that's the one that's approved and safe for our data. The skills you've learned today — the four levers, templating, guardrails — work in *every* one of these tools, and they'll work in whatever comes next. You're not learning a tool today; you're learning a way of thinking.

Q Is our data safe? Where does this go?

A On the company account, it's governed by VEKA's agreement — that's why we use it and not a random free tool. But the golden habit we practised all afternoon holds everywhere: no real customer data, no salaries, no live financials pasted in during learning or experimenting. Use masked or synthetic data to build and test, then apply it to real data only inside approved systems. When in doubt, mask it.

Q I'm not technical — is this really for me?

A This is *most* for you. The technical folks were already going to find AI eventually. The advantage today goes to the person who knows the VEKA work cold — the supplier, the customer, the process — because you supply the judgement, and the AI supplies the typing. You've done every exercise today. You've already proven it's for you.

Q It didn't understand what I wanted.

A Then it's missing one of the four levers — Context, Tone, Persona, or Format. Nine times out of ten it's Context: you know something it doesn't. Tell it who you are, what's really going on, and what a good answer looks like, then run it again. Don't argue with a bad answer — improve the instruction.

Q Isn't it cheating / lazy to use this?

A Is using a calculator cheating? A forklift? This is a tool that does the tedious part so your skill goes further. The lazy move is doing avoidable drudgery by hand and having no time left for the work that matters. Using this well is a skill in itself — that's the whole point of today.

Q This is moving so fast — won't today be outdated soon?

A The tools will change — guaranteed. But nothing you learned today is about a specific button. Briefing instead of asking, the four levers, templating, keeping a human in the loop — those are durable. They worked on last year's tools and they'll work on next year's. You learned the thinking, not the software.

APPENDIX

Reference cards

A · Capstone judging score sheet (1–5 each)

Criterion	1	3	5
Problem clarity	Vague	Real, loosely scoped	One sharp, named bottleneck
Solution reliability	Works once	Works with tweaks	Clean on 3+ inputs
Before/after impact	Asserted	Shown	Quantified
Reusability	One-off	Could be templated	Already a card
Demo confidence	Rambling	Clear	Tight, answered the hard Q

Audience bonus +3 to the three biggest reactions. Every demo +5 · winner +10 · winning solutions enter the library.

B · VEKA Prompt Library card template

TEMPLATE NAME:
 DEPARTMENT: [Finance / Sales / Operations / HR]
 WHAT IT DOES: (one line)
 WHEN TO USE IT: (one line)
 THE TEMPLATE: (full prompt with [BRACKETED_VARIABLES])
 GUARDRAILS: (1-2 lines, e.g. "never invent a date; ask if missing")
 FILLED EXAMPLE: (one worked example, synthetic values)
 AUTHOR / DATE:
 REUSE RATING: __ / 5

C · Participant 30-day plan (hand out)

MY GENAI 30-DAY PLAN - [Name, Department]
 1. WEEKLY HABIT (from Monday): Every week I will use AI to _____.
 2. TEMPLATE I'LL SHARE: I'll give _____ my "_____" template by [date].
 3. PERSON I'LL TEACH: I'll show _____ how to _____ by [date].
 4. HOW I'LL KNOW IT WORKED: Track _____ Review on [date].

D · Synthetic data pack (prepare before you start)

- Vendor ledger** (Hour 4) — ~15 rows of P0 | Invoice ₹ | Paid ₹ | Date ; seed two duplicate rows, one invoice≠paid mismatch, one currency-symbol typo.
- Shift notes** (Hour 3) — the 5 messy bullets scripted in Hour 3.
- Maintenance log** (Hour 4) — ~20 lines of Machine | Date | Issue | Downtime(min) ; one machine

clearly worst by total downtime; one issue type repeated across machines.

4. Weak prompt (Hour 2) — "write something about a price increase to a customer."

E · Timing contingency (if behind)

Cut in this order — always protect the doing over the talking: **1.** Trim concept SAY blocks to their headline + one line. **2.** Drop Prompt Battle #2, keep #1. **3.** Shorten Hour-5 lead-gen or Hour-3 vendor activity — never the handover or reconciliation. **4.** Cut Hour-7 demo prep to 5 min. **Never cut:** the Hour-1 win, the reconciliation, the capstone build, the 30-day plan — those are the day's spine.
